

TRUSTED THIN CLIENT (TTC): REMOTE

Utilizing as part of the CSfC Program to protect classified information

In order to achieve mission objectives, U.S. Government customers require immediate use of the market's most modern commercial hardware and software technologies within National Security Systems (NSS). Consequently, the National Security Agency/Central Security Service (NSA/CSS) has developed ways to leverage emerging technologies to deliver rapid cybersecurity solutions for swiftly evolving customer requirements.

This includes the fact that the NSA/CSS has established a Commercial Solutions for Classified (CSfC) Program that enables commercial products to be used in layered solutions in order to protect classified NSS data. This framework provides the ability to deploy a secure solution based on approved commercial standards that can be fielded in months, not years.¹

Furthermore, the NSA National Cross Domain Strategy & Management Office (NCDSMO), which serves as the focal point for U.S. Government cross-domain capabilities, has implemented a "Raise the Bar" strategy with a scope that encompasses detailed reviews of design, development, assessment, implementation and use perspective. With the assistance of Commercial Solutions from cross-domain providers, NCDSMO and its "Raise the Bar" strategy improves security posture and the ability to address constant, emerging threats, while at the same time meeting mission requirements and, additionally, providing lifecycle affordability.

CDW·G Expertise

CDW·G is an approved NSA Commercial Solutions for Classified technical integrator, and has trusted and deep partnerships with best-in-class industry providers and vendors. CDW·G has deployed multiple CSfC solutions across the Department of Defense, which allow users to access multiple networks through a single end-user device. The solutions enable users to log in securely to a virtual desktop infrastructure environment from their devices. From that environment, users can access multiple VPNs with different firewalls that control how traffic can travel, depending on what a user is authorized to access.

Specifically, the introduction of the Trusted Thin Client: Remote (TTC: Remote) product has served to achieve the goals of the NCDSMO strategy. TTC: Remote accomplishes this by supporting missions with improved, streamlined and secure information sharing and access capabilities across separate, compartmented networks and clouds, regardless of enterprise size. Device and network user administration is streamlined using a central administration hub on the Distribution Console for both TTC and TTC: Remote user terminals.

"We know how to Register, Design, Integrate, and Sustain Cross-Domain Solutions that support Multi-Domain Operations."

*Peter Dunn
CDW·G
Chief Technology Officer, DoD and Intel*

Use Cases

Specific use cases for the Trusted Thin Client: Remote (TTC: Remote) include the following:

- Wireless access inside a Sensitive Compartmented Information Facility (SCIF) – temporary/mobile workspace pools
- Unclassified, cross-domain home telework
- Small remote agency office access with insecure links
- Inter-agency remote access
- Industrial or critical-infrastructure cross-domain field access

In the end, Trusted Thin Client (TTC) and TTC: Remote deliver the most robust combination of security, flexibility, usability, and reduced total cost of ownership. In fact, a June 2017 independent Forrester study of the Trusted Thin Client (TTC) in use at a DoD intelligence agency revealed a 54% return on investment (ROI) over a 6.2-month payback period by significantly reducing hardware infrastructure, support costs and power usage.

54% return on investment (ROI) over a 6.2-month payback period by significantly reducing hardware infrastructure, support costs and power usage.

Solution Architecture

Forcepoint Trusted Thin Client (TCC) is a secure, multi-network access solution that solves the difficult problem of satisfying security needs while enhancing user productivity, regardless of a user's physical location. Trusted Thin Client (TCC) supports DoD initiatives, such as the DoD Joint Information Environment (JIE), by providing robust centralized management for multiple form factors, globally dispersed sites and thousands of users. An image representing network access is shown in Figure 11.

Figure 11: ForcePoint Trusted Thin Client: Remote.

Forcepoint Trusted Thin Client Remote utilizes the standard accredited Forcepoint Trusted Thin Client solution, with additional endpoint and communication security technologies, to permit roaming access from standard-issue laptops and hybrid devices.

CDW·G and Forcepoint: A Beneficial Partnership

Forcepoint trusted integrators use Forcepoint Cross-Domain solutions to offer a complete turnkey CSfC mobility solution. Forcepoint Cross-Domain solutions have a proven track record of proactively preventing government and commercial organizations from being compromised, while at the same time fostering the secure access and transfer of information. These solutions strike the right balance between information protection and information sharing – a vital component to global and national security – and are designed to meet or exceed extensive and rigorous security Assessment & Authorization (A&A) testing for simultaneous connections to various networks at different security levels.

By working with CDW·G and Forcepoint to garner these solutions, government customers can realize an array of benefits:

▪ Significant ROI through lower ownership costs (i.e., infrastructure, office space, power consumption and administration)	▪ Maximized security, usability and adaptability
▪ A commercial, off-the-shelf solution (CoTS)	▪ Streamlined enterprise administration
▪ Secure connectivity and data processing over unclassified connections	▪ Support for DoD and IC VDI initiatives such as the DoD Joint Information Environment (JIE)
▪ No Type-1 crypto or key required	▪ Flexibility to support environments with 2 networks or more than 50 networks and up to 150,000 users
▪ Can be in a mixed environment with Trusted Thin Client deployed at the site	▪ Trusted Thin Client: Remote and Trusted Thin Client 2.0 meet NCDSMO security guidelines under Raise the Bar (RTB) for Secret and Below Interoperability (SABI) and Top Secret and Below Interoperability (TSABI)
▪ Increased user productivity	▪ Adheres to NSA Mobility Office guidance for use in Commercial Solutions for Classified Program (CSfC) as an approved mobile access capability solution
▪ Ability to securely connect to classified networks from unclassified locations leveraging CSfC technology (approved for classified processing)	▪ Use dual NSA CSfC approved CNSA Suite VPNs for access
▪ Can provide single-level data access (e.g., secret) with the ability to scale to support multiple levels	▪ Support both hardware- and software-level disk encryption
▪ Device is encrypted at rest with no user data or applications are stored on the user endpoint	▪ Perform tamper-proof hardware verification
▪ A single, secure connection to access multiple networks, multiple clouds (i.e., public, private) with no data stored locally – read-only	▪ Allow secure field updates of TTC host OS image
▪ Support for a wide variety of back-end virtualization servers, including Citrix, Microsoft and VMware	▪ Support webcams, smart cards, multimedia redirection and unified communications
▪ Distribution consoles serve multiple clients and span geographically	▪ Support flexible Linux or Windows outer tunnel VPN client deployment options
▪ Ability to access non-local VDI with Distribution Console spanning	▪ Use off-the-shelf (approved and qualified) laptop and tablet hardware
